Introduction

Mapgen has its roots in osmdiff.pl and osmrender.pl. They were very basic render programs. Once Haiti was hit by the strong earthquake I wanted to provide large png maps for the local help. This proved to be hard since so many things couldn't be done with my programs. So I decided to improve the features of my renderer and give it a new name. So the basic goals became:

- Fast and easy map generation, different output formats
- Fast extraction of needed data out of *.osm files (place=*)
- Easy style file handling
- Street and place directories
- Keep it simple (easy invocation with only 2 mandatory parameters)
- Keep it powerful (by using more parameters)

Hints

The projection method used is not appropriate for very big areas.

Be aware that at the edges of the map items may be missing. This may occur when items are not completely contained in the osm file. You can try to prevent this by using the clip parameter with larger values.

Installation

- Put the mapgen.pl file in a folder
- Put *.pm files in a subfolder called OSM (can also be put into a directory contained in the @INC pathes)
- Get Math::Poygon from CPAN and create a subfolder Math (can also be put into a directory contained in the @INC pathes)
- (Install osmosis if desired; take care that it can be invoked from command line)
- (Install inkscape if desired; take care that it can be invoked from command line)

Basic parameters

Obviously there are some things that can't be hidden from the user. So the user has to specify at least 2 basic parameters:

```
-in=file.osm
-style=style.csv (original can be kept and maintained in OO sheet or MS Excel)
-in also supports *.osm.bz2 format.
```

Default output name is mapgen.svg.

Output

Basic and only output format from mapgen itself is SVG. That has the advantage that all further formats contain all elements that mapgen can produce. Disadvantage is a post-processing done by inkscape.

```
-out=file.svg (png and pdf names are automatic, DEFAULT=mapgen.svg)
```

There are two options specifying additional output formats:

```
-png (also produce png, inkscape must be installed, very big)
-pdf (also produce pdf, inkscape must be installed)
```

The names are automatic and derived from the -out name. Inkscape must be installed and your system must be able to run it from command line in the current directory.

The PNG files are rather big. So maybe some post-processing is appropriate.

Usage examples

Most **simple** form:

```
perl mapgen.pl -in=file.osm -style=mapgenRules.csv
```

Also specify an output name, if you wish

```
perl mapgen.pl -in=file.osm -style=mapgenRules.csv -out=map.svg
```

Also specify **size** and that you want a **PDF** additionally:

```
perl mapgen.pl -in=file.osm -style=mapgenRules.csv -size=2048 -pdf
```

Now let's say you have a big osm file but only want a **map of a certain city**:

```
perl mapgen.pl -in=germany.osm -style=mapgenRules.csv -place=Frankfurt
```

This will probably not cover the whole of Frankfurt because the default **radiuses** are too small (2km each direction)

```
perl mapgen.pl -in=germany.osm -style=mapgenRules.csv -place=Frankfurt -lonrad=10
-latrad=10
```

Now we want our map with **grid lines** and a **street directory**:

```
perl mapgen.pl -in=file.osm -style=mapgenRules.csv -grid=8 -dir
```

And let's turn off the **legend**:

```
perl mapgen.pl -in=file.osm -style=mapgenRules.csv -legend=0
```

Map size and the like

The background color can be set according to the given color set.

The size of the picture is specified by the width in pixels. Height is automatically calculated.

Clipping means that not all of the data given in the osm file will be presented. This is useful to clip incomplete data at the edges of the area in the osm file.

```
-bgcolor=TEXT (color for background)
-size=<integer> (in pixels for x axis, DEFAULT=1024)
-clip=<integer> (percent data to be clipped on each side, 0=no clipping, DEFAULT=0)
```

Advanced parameters

By default a legend is drawn in the upper left corner. This can be switched off.

```
-legend=INT (0=no legend; 1=legend; DEFAULT=1)
```

A ruler is drawn by default in the upper right corner. This can be switched off as well. Additionally a color can be specified.

```
-ruler=INT (0=no ruler; 1=draw ruler; DEFAULT=1)
-rulercolor=TEXT (DEFAULT=black)
```

Optionally a scale value can be calculated and added to the map. Of course the color for this text can be set.

```
-scale (print scale)
-scalecolor=TEXT (set scale color; DEFAULT = black)
```

A specific scale can be set. i.e. 1:25.000 by adding -scaleset=25000 to the command line. To be able to work with this information you have to specify the resolution of the output device in dpi. By default this is set to 300dpi.

```
-scaleset=INTEGER (1:x preset for map scale; overrides -size=INTEGER! set correct printer options!)
-scaledpi=INTEGER (print resolution; DEFAULT = 300 dpi)
```

Setting the scale overrides the -size parameter!

The program will in any case print information on how big the map will be and on what paper size it will fit.

Style file format

File

Nodes

Column #	Name	Values	Description
1	key	see wiki	
2	value	see wiki	
3	color	see separate table	the fill color
4	thickness	INTEGER	
5		key, where value will be the label text; entries can be separated by ! or #. !=AND. #=PRIO special keys: _lon and _lat	
6	label color	see list below	
7	label size	INTEGER	size of text
8	label offset	INTEGER	offset in y direction for multiple labels per node
9	legend	0 or 1	
10	Icon	File name	
11	Icon size	In pixels	

Ways

Column #	Name	Values	Description
1	key	see wiki	
2	value	see wiki	
3	color	see separate list	the fill color
4	thickness	INTEGER	thickness of line
5	dash style	1-4; 10-14; 20-23	determines the style of the dashes forming the way
6	fill	0 or 1	0 = area will not be filled; 1 = area will be filled
7	label	key, where value will be used as label text. entries can be separated	

		by ! or #. !=AND. #=PRIO special keys: _lon and _lat	
8	label color	see below	
9	label size	INTEGER	font size
10	label font- family	see below	
11	label offset	INTEGER	offset for label text in y-direction (negative = up, positive = down)
12	legend	0 or 1	entry for automatic legend (0=no, 1=yes)
13	base layer	0 or 1	applies for areas (closd ways). areas tagged with 1 are drawn as "background" first. use for landuse, natural etc.

Using _lon and _lat you could nicely label a natural=peak, using a second rule for elevation i.e:

Routes

Column #	Name	Values	Description
1	RouteType	bus, hiking - see wiki	
2	Color(s)	All valid colors	A set of colors can be given by using the; as a delimiter
3	Thickness	INTEGER	of the line
4	DashType	See above	of the line
5	Opacity	0100	opacity in percent
6	Label	Valid keys	Key to get the label from
7	StopNodeT hickness	INTEGER	

The colors will be assigned to each found route in order of occurrence in style file if no k/v for the colors are present in the osm file.

Additionally the labels can be configured by command line parameters:

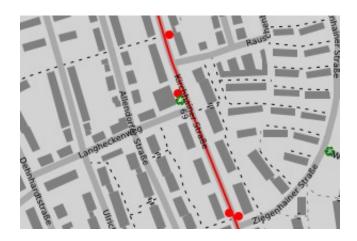

- -routelabelcolor=TEXT (color for labels of routes)
- -routelabelsize=INTEGER (DEFAULT=8)
- -routelabelfont=TEXT (DEFAULT=sans-serif)
- -routelabeloffset=INTEGER (DEFAULT=10)

Bus routes in Frankfurt

Hiking routes in the Taunus

Some bus stops in Frankfurt

Route icons

Aditionally icons for routes can be added to the map if icons are provided as follows. Create folder "routeicons" and save icons there. As the file name choose the ref or the name of the route preceded by the route type and a dash. **If the route has a ref the ref has to be used!**

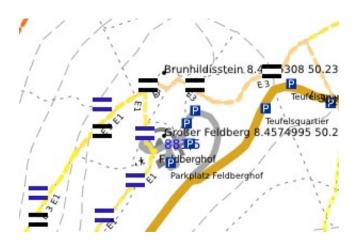

Example: ./routeicons/hiking-E3.png OR ./routeicons/hiking-E3.svg

The default icon directory can be changed.

```
-icondir=TEXT (dir for icons for routes; ./icondir/ i.e.; DEFAULT=./routeicons/ )
```

You can also change the default distance of 25 pixels between multiple icons for same way.

-routeicondist=INTEGER (dist in y direction for route icons on same route; DEFAULT=25)

Colors

00.0.0			
aliceblue	darkred	lavenderblush	midnightblue
antiquewhite	darksalmon	lawngreen	mintcream
aqua	darkseagreen	lemonchiffon	mistyrose

Extracts

If you don't wan't the whole osm data to be printed that is contained in the file – no problem. As long as you have installed osmosis and this can be invoked from the current directory by command line. Just specify the name of a place and mapgen will look for such a place. Upon success it will invoke osmosis to extract the needed data. By default a width and height of 4km (2*2km radius) is set. But of course it can be overridden.

⁻place=TEXT (Place to draw automatically; quotation marks can be used if necessary; OSMOSIS REQUIRED!)

⁻lonrad=FLOAT (radius for place width in km, DEFAULT=2)

⁻latrad=FLOAT (radius for place width in km, DEFAULT=2)

Declutter

Usually when drawing maps (especially with lots of details) clutter may occur. To prevent this you may specify the option -declutter. Three things will then happen:

- Motorways and trunks will be labeld only in one direction
- mapgen will register an used area for each drawn label (except street labels) and won't use this area again.
- mapgen will register an used area for each drawn icon and won't use this area again.

The area occupied by each label is 100x10 pixels. But both values can be changed. The area for icons depends on the largest specified icon in the style file.

```
-declutter (declutter text; WARNING: some labels might be omitted; motorway and trunk will only be labeled in one direction)
-declutterminx=INTEGER (min distance for labels on x-axis in pixels; DEFAULT=100)
-declutterminy=INTEGER (min distance for labels on Y-axis in pixels; DEFAULT=10)
```

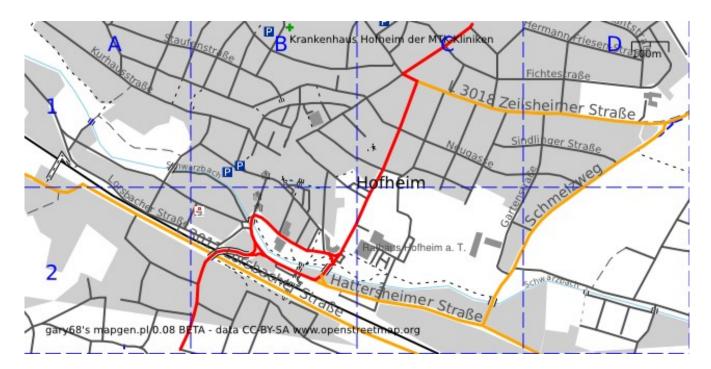

mapgen tries not to put labels on ways that are too short. To do so it calculates the length of the way and the length of the text. This is done by assuming a need of 5.5 pixels per character for a 10pt font. Other font sizes are calculated automatically. If you find out that 5.5 ppc doesn't suit your used font, please reconfigure the value using the following option.

```
-ppc=<float> (pixels needed per label char using font size 10, DEFAULT=5.5)
```

Grids, directory and stats

A grid can be laid over the map. Just specify the number of squares you want in longitude direction. The other dimension is automatic. Of course you can specify the grid color. The grid squares are labeled numerically and alphabetically.

```
-grid=<integer> (number parts for grid, 0=no grid, DEFAULT=0)
-gridcolor=TEXT (color for grid lines and labels (DEFAULT=black)
```

Street directory

mapgen can even create a street directory. It will do so including the grid squares where the street is located if the grid is turned on. Output is an unformatted street list to be further processed. The grid squares are separated by a tab. File name is name_streets.txt.

```
-dir (create street directory in separate file. if grid is enabled, grid squares
will be added)
```

In the next table you can see a section of the street directory. On the left without grids, on the right with grid squares:

Burgstraße	BurgstraßeB1
Cohausenstraße	CohausenstraßeA1 A2 B1
Crufterostraße	CrufterostraßeD2
Elisabethenstraße	ElisabethenstraßeB2 C1 C2 D1 E1
Eschborner Weg	Eschborner Weg
Feldbergstraße	FeldbergstraßeA1 B1

Poi and place list

You can print a poi and place list like the street directory. Grid option applies as well.

-poi (create list of pois)

Delkenheim	.C5
Diedenbergen	
Eddersheim	
Edeka Kundenparkplatz	.G7
Falkenberg (Keramag)	.E7
Flörsheim	.F6
Geldautomat	.C1

Statistics

You can print a tag statistic about the usage of the keys and values. To keep the list short unimportant keys are omitted. This must be adapted in the code if desired.

The idea is to see what keys are used mostly. So you can decide for which features rules are needed.

Mapgen will print an alphabetical list of keys and values as well as a list of the most used k/v combinations. At the end of each line the program prints if it knows a rule for that k/v.

-tagstat (lists keys and values used in osm file; program filters list to keep them short!!! see code array noListTags)

```
TOP 20 LIST:
highway
                       residential
                                                            123 RULE
highway
                                                             51 RULE
                       footway
                                                             38 -
oneway
                       yes
highway
                                                             21 RULE
                       service
                                                             19 RULE
highway

                                                             14 -
                       steps
                                                             12 -
foot
                        yes
highway
                        secondary
                                                             11 RULE
building
                       yes
                                                             10 RULE
                       yes
bicycle
                                                             10 -
                      parking
amenity
                                                             10 RULE
                                                             9 –
surface
                       cobblestone
                                                              8 –
service
                       parking_aisle
                                                              8 –
highway
                       pedestrian
landuse
                       residential
                                                              6 RULE
highway
                       track
                                                              6 RULE
highway
                                                              5 RULE
                                                              5 -
highway
                       living_street
amenity
                       restaurant
                                                              5 -
                                                              5 -
amenity
                        pharmacy
```

Obviously we should maybe implement a rule for oneway=yes. And we can see that by far the most

used tag here is highway=residential.

Coordinates Grid

You can add a grid of coordinates to your map by specifying the -coords option. By default the grid distance is 0.01 degrees.

This can be changed by using the -coordsexp parameter. The value given here is the power of 10. (-2 means 0.01 degrees, 2 means 10 degrees).

And of course the color can be changed.

```
-coords (turn on coordinates grid)
-coordsexp=INTEGER (degrees to the power of ten for grid distance; DEFAULT=-2
equals 0.01 degrees)
-coordscolor=TEXT (set color of coordinates grid)
```

Debug

Verbose will turn on lots of information to be printed while program executes. This is mostly done for debug purposes.

-verbose

If you want to print a map only containing multipolygons you can specify so. This is also a debug function, although a graphical one.

-multionly (draws only areas of multipolygons; for test purposes)
